## Experience

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2022 till now | <b>Software engineer at RH Marine BV</b><br>At RH Marine I was responsible for laying out an architecture plan and create a suite of NextJS-apps for the Anti-Submarine WarFare (ASWF) ships, to be delivered in 2027. This included creating a complete new component library using designs from Figma. Other dedicated applications I worked on include: Battle Damage Repair-Support Tool (BDR-ST), Automated Advice Functions (AAF) and Mobility Navigation Assistant (MNA). All these apps ran inside a new shell application for the ship, that I contributed code to. |
| 2019 - 2022   | <b>Front-end developer at Softpak BV</b><br>Tasked with developing tools and a application, built with Angular, so that the windows-based logistics software runs inside a browser. The solution we created was a cloud-based application that houses multiple individual modules that could be enabled per customer, depending on their needs.                                                                                                                                                                                                                              |
| 2016 - 2019   | <b>Front-end developer at Ticketcounter BV</b><br>My responsibilities included managing existing ticketing solutions for customers, as well as helping develop a scalable framework for quickly deploying new ticket shops. Technologies used include PHP and vanilla JavaScript/HTML and CSS.                                                                                                                                                                                                                                                                               |
| 2014 - 2016   | <b>Front-end developer at Zeit.io GmbH</b><br>Worked for multiple clients directly to create websites and apps built using Ruby on Rails and AngularJS.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 2012 till now | <b>Freelance software developer</b><br>In my free time I manage and develop websites for clients. As a solo developer, I have free reign to choose and learn new technologies and implement those to meet the goals of my clients.                                                                                                                                                                                                                                                                                                                                           |

## Skills

- ReactJS/Native, NextJS, Angular, TypeScript/vanilla JavaScript, HTML and CSS.
- Writing maintainable code and tests.
- Setting up CI/CD pipelines.
- Experience setting up containerized projects, such as Docker and Kubernetes.
- Experience with version control software such as Git.
- Experienced in agile development and tools that enable them; e.g. Azure DevOps and Gitlab.
- Cloud services for hosting content and databases: Firebase, MongoDB, AWS, Google Cloud and Azure Cloud.
- Experienced in using CLI's for Linux, Mac and Windows operating systems.
- Practical experience using Adobe Photoshop and Illustrator.

## Education

Graduated in 2013 with a bachelor of Communication at the Erasmus University of Applied Sciences.
