Experience

Software engineer at RH Marine BV (since 2022)

The navy required a new generation of software for its Anti-Submarine Warfare (ASWF) ships, built with C# and Javascript. I helped multiple teams setup the foundation for a NextJS architecture layout for apps and a library for reusable components using Figma. I've worked on dedicated apps such as the "Battle Damage Repair-Support Tool" that require high responsiveness during wartime because people's lives depend on the functionality of the systems. Other apps include "Automated Advice Functions" (AAF) and "Mobility Navigation Assistant" (MNA).

Recent work at the company were aimed at developing Android apps using AI agents. These apps communicate with other .Net backends to automate certain parts of the ship, allowing the navy to do the same tasks but with less man-power. It also allowed me to learn more about other programming languages such as C# and Kotlin.

Front-end developer at Softpak BV (2019 - 2022)

Tasked with developing tools and a cloud-based app to replace a Windows-based logistics software. I made the frontend using Angular and worked together with other developers on maintaining a component library. This web-app was built from the ground up to be modular, so customers could freely choose whichever software to subscribe to, that best fit their operational goals. The modular approach is in use by container terminals and expedition companies.

Front-end developer at Ticketcounter BV (2016 - 2019)

My responsibilities included managing and creating new ticketing solutions for customers, as well as helping develop a scalable framework for quickly deploying new ticket shops. Technologies used include PHP and vanilla JavaScript/HTML and CSS.

Front-end developer at Zeit.io GmbH (2014 - 2016)

Worked for multiple German and Dutch clients directly to create websites and apps built using Ruby on Rails and AngularJS.

Skills

Programming languages:

Full mastery of ReactJS, React Native, Angular and Vue. This includes HTML and CSS. I love to write maintainable and testable code, setting up pipelines for CI/CD for automating deployments, testing and linting of code. This allows me and the people that I work with to standardize coding practices and deliver constant quality across applications.

DataBases:

Worked with several cloud and local based solutions for databases. Such as FireBase, MongoDB, AWS, Google Cloud and Azure.

Containerization:

I have experience with using Docker and Kubernetes.

Version management:

Full mastery of Git (also command line).

Agile workflow:

Due to previous work experiences allowed me to learn all about Azure DevOps, Jira, GitHub and GitLab.

Other:

Used Windows-based computers since I was a child. Worked with Mac the last years due to my Ruby experience, which wasn't available for Windows at the time. I have full knowledge of handling CLI-based Linux VM's such as Ubuntu.

Practical experience with Figma, Photoshop and Illustrator.

I love playing volleyball in my spare time, and have since I was 7 years old. I think due to that I am a good team player.

Education

Graduated in 2013 with a bachelor of Communication at the Erasmus University of Applied Sciences.
